# 2.5 L6-Special Lines in Triangles

Median: A line that joins vertex of a triangle to th midpoint of the opposite side.

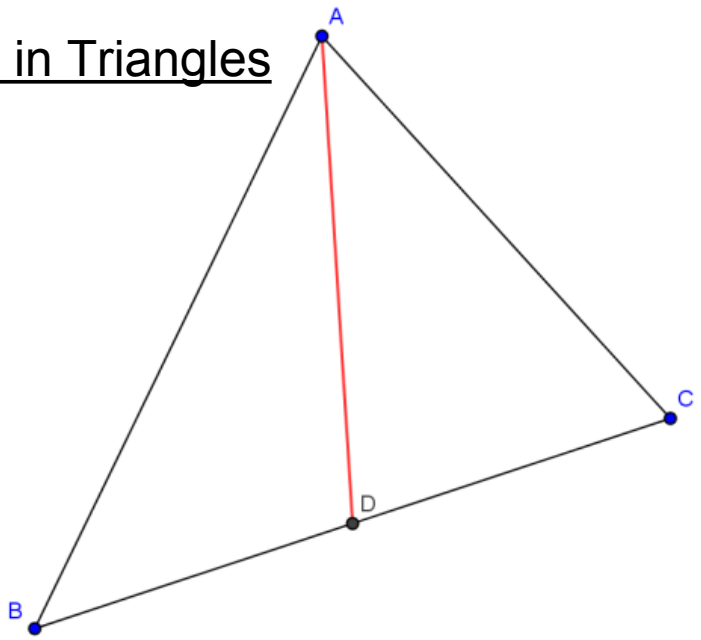
1) Midpoint = $M_{BC}$

2) $m_{AD} = \frac{y_D - y_A}{x_D - x_A}$

3) Sub A or D into

$y = m_{AD}x + b$

to solve b



Altitude: A line fro to the opposite sid is perpendicular to opposite side.

1) find slope $m_{BC}$

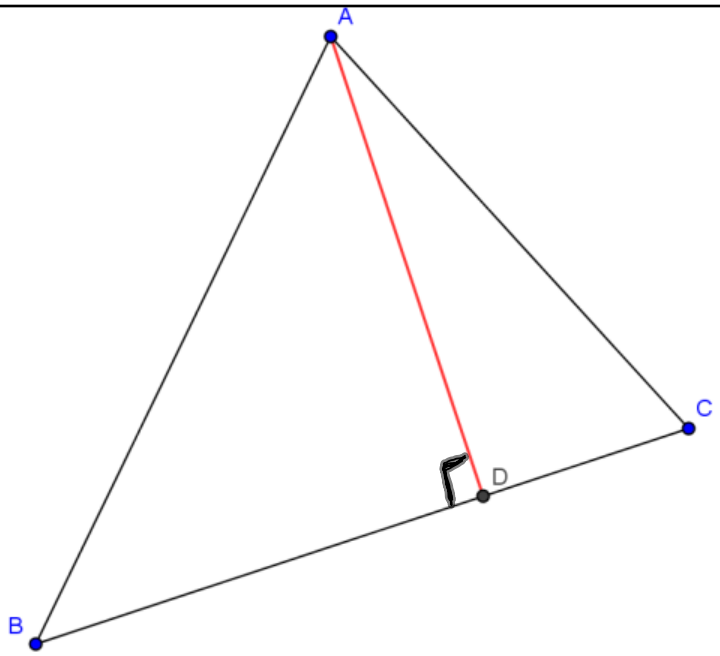
2) state $m_{AD} = -\frac{1}{m_{BC}}$

3) $y = m_{AD}x + b$

4) sub point A into

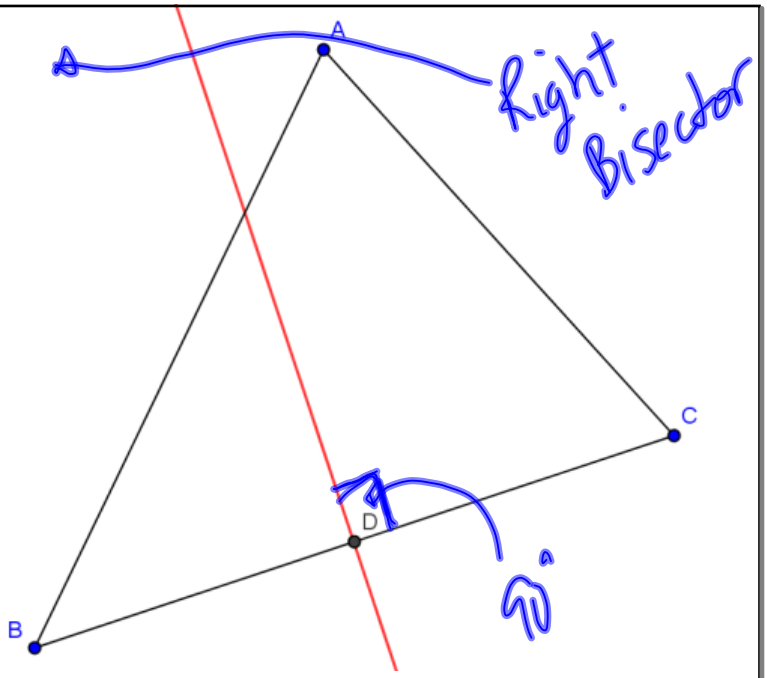
$y = m_{AD}x + b$

to solve b



## Perpendicular Bisect

A perpendicular line through the midpoint of a line segment.



1) Midpoint = $M_{BC}$

2) find slope $m_{BC}$

3) state $m_{\perp}$ = $-\frac{1}{m_{BC}}$

4) $y = m_{\perp} x + b$

3) Sub D into

$y = m_{\perp} x + b$

to solve b

L6-Special Lines in Triangles

Important: make a sketch so you don't get confused.

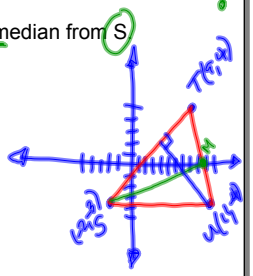
Ex. 1 Triangle STU has vertices at S(-2,-3), T(9,4) and U(11, -4).

a. Find the equation of the median from S.

$M_{TU} = \left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$

$= \left(\frac{9+11}{2}, \frac{4+(-4)}{2}\right)$

$= (10, 0)$



$m_{RS} = \frac{y_2-y_1}{x_2-x_1}$

$= \frac{0-(-3)}{10-(-2)}$

$= \frac{3}{12}$

$= \frac{1}{4}$

$y = \frac{1}{4}x + b$

Sub (10,0) to solve b

$0 = \frac{1}{4}(10) + b$

$0 = \frac{10}{4} + b$

$b = -\frac{5}{2}$

∴ the equation of the median is $y = \frac{1}{4}x - \frac{5}{2}$

Ex.1 continues...
Triangle STU has vertices at S(-2,-3), T(9,4) and U(11, -4).

b. Find the equation of the altitude from U.

$m_{TS} = \frac{y_2-y_1}{x_2-x_1}$

$= \frac{4-(-3)}{9-(-2)}$

$= \frac{7}{11}$

$m_{\perp} = -\frac{11}{7}$

$y = -\frac{11}{7}x + b$

sub U(11, -4) to solve b

$-4 = -\frac{11}{7}(11) + b$

$-4 = -\frac{121}{7} + b$

$-4 + \frac{121}{7} = b$

$-\frac{28}{7} + \frac{121}{7} = b$

$\frac{93}{7} = b$

$b = \frac{93}{7}$

∴ the equation of the altitude is $y = -\frac{11}{7}x + \frac{93}{7}$

Ex.1 continues...
Triangle STU has vertices at S(-2,-3), T(9,4) and U(11, -4).

c. Find the equation of the perpendicular bisector of side TU.

$M_{TU} = (10, 0)$

$m_{TU} = \frac{y_2-y_1}{x_2-x_1}$

$= -4$

$m_{\perp} = \frac{1}{4}$

$y = \frac{1}{4}x + b$

sub (10, 0) to solve b

$0 = \frac{1}{4}(10) + b$

$0 = \frac{10}{4} + b$

$-\frac{10}{4} = b$

$b = \frac{-5}{2}$

∴ the right bisector is $y = \frac{1}{4}x - \frac{5}{2}$

Assigned Work:

Triangle ABC has vertices A(3, 4), B(-5, 2) and C(1, -4). Find the equation for the altitude from A to BC.
